

## Introduction to Ebiox

### Advanced Decontamination Technology

Ebiox produces decontamination products that represent the latest advances in hygiene and infection control. The Ebiox 'Advanced Decontamination Technology' range has been specifically designed to assist in the control of potentially harmful pathogens and reduce the risk of cross infection.

Delivering safe and user-friendly products has been the Ebiox mission since its formation in the late 1990's when a need was recognized for a range of products that could effectively clean and disinfect any washable surface in the presence of soiling.

Following the successful introduction of the instrument cleaning and surface disinfection ranges, Ebiox identified the need for a range of hand hygiene products that were both alcohol and chlorhexidene free, yet performed just as effectively. The Esense range of hand wash and hand rub products are proven to be as effective as alcohol-based products yet without the perceived skin damaging side effects, or the storage issues associated with highly flammable chemicals.

Continual Research and Development at Ebiox is central to solving the many factors that can affect the performance requirements of a hygiene product, and to creating products that are safe and pleasant to use that in turn encourages compliance with best hygiene protocols.

The Esense range has been independently tested to prove its efficacy and all referenced data is available on request. Compliance with hand hygiene protocols has increased with focus on the issues and education, however there remains scope for improvement. One of the key reasons still stated for non-compliance is the dislike of using products that can dry and irritate the skin. Ebiox non-alcohol based products address this.

**Trionic™**

**Esense™**

**Neozyme™**

**Ultra™**

Advanced hygiene regimes

## Environmental Hygiene:

Two requirements - one solution. The development of the Ebiox environmental hygiene products resulted in formulations that include surfactants to achieve soil removal but also include a blend of actives that have proved to be extremely effective against both gram positive and gram negative bacteria, fungi and viruses, and is tuberculocidal. The Trionic range is available in wipes, spray, and concentrate formats to suit all healthcare professionals, for both medical devices and equipment, and hard surfaces.

## Hand Hygiene:

It is well recognised that good hand hygiene practice is the single, most effective means of preventing healthcare associated infections. Esense™ Hand Wash removes transient organisms as well as reducing resident organisms to a 'safe' level. Esense non-alcohol based Hands Rubs are highly effective and user friendly. Ask for details about the Esense Hand Wash and non-alcohol based Hand Rub range.

## Instrument Cleaning:

The cleaning of surgical instruments is of critical importance and is the essential prerequisite to disinfection and sterilisation. The patented range of Ebiox surgical instrument decontamination products cleans to a molecular level, removing body fluids, organic matter and micro-organisms from the surface of instruments. Ask for details about the Neozyme and Ultra ranges.

### Choosing the best Ebiox products for you:

Ebiox products are used extensively in the Primary Care, Community Care, Dental, Podiatry, and Veterinary professions. Please visit the Ebiox website to access the entire range.

If you require assistance to select the appropriate Ebiox products for your healthcare activity please call our sales team, or your local Ebiox distributor.
